1. Introduction

1.1 Purpose

This Business Requirements Document (BRD) defines the business needs, scope, and functional and non-functional requirements for Task Wall, a lightweight web-based application for capturing, tracking, and reporting on tasks (referred to as "tickets") that typically originate from email and voice notes. It is intended to align stakeholders on what the application must do and to serve as the reference baseline for design, development, testing, and acceptance.

1.2 Background

Knowledge workers frequently receive actionable items by email and need a fast, personal way to record what must be done, who is involved, and the follow-up details, without the overhead of a heavyweight project-management tool. Task Wall addresses this by letting a user paste a formatted email (or dictate by voice), pin it to a date, capture the associated people and email metadata, break the work into sub-steps, and export or print the results on demand.

1.3 Scope

Task Wall is a single-file, browser-based application that runs entirely on the user's device. It stores data locally in the browser and provides on-demand export to PDF, Excel, HTML, and JSON. The application is designed for individual use; it does not require a server, user accounts, or network connectivity except to load a small number of formatting libraries and to display remote email images.

1.4 Definitions and Glossary

Term	Meaning
Ticket / Task	A single work item recorded on the wall, containing the task text plus optional metadata.
Wall	The main screen that displays tickets grouped by date.
POC	Point of Contact — a person associated with a ticket.
Sub-POC	An additional contributor recorded with a note of what they did.
Step	A sub-task within a ticket that can be individually checked off.
Open / Closed	The status of a ticket; Closed means completed.
Rich paste	Pasting content that preserves its original formatting, images, and tables.
Current view	The set of tickets currently shown after applying date, month, status, and search filters.

2. Business Objectives

- Provide a fast, low-friction way to capture email- and voice-originated tasks without losing their formatting.
- Keep all task context in one place: the message, the people involved, the email reference details, and the follow-up steps.
- Let the user see only what is relevant — by default the current day — and drill into any date, month, or keyword on demand.
- Enable professional, shareable output (PDF, Excel, HTML for printing) sized to the user's needs.

- Guarantee the user never loses work through automatic local saving plus portable JSON backup and restore.
- Require no installation, server, or account — the entire tool is a single file the user controls.

3. Stakeholders and Users

Stakeholder	Interest / Role
Primary user	An individual professional who receives tasks by email/voice and must track and report on them.
Reviewer / Manager	Consumes exported PDF, Excel, or printed output to review status and follow-ups.
Product owner	Defines requirements and prioritises enhancements.
Developer	Implements and maintains the single-file application.

4. Assumptions and Constraints

4.1 Assumptions

- The application is used primarily on a desktop browser (Chrome or Edge recommended), with basic support on mobile.
- The user has occasional internet access to load formatting libraries and to view remote email images.
- Each installation serves a single user on a single browser profile.

4.2 Constraints

- Data is stored in the browser's local storage; it is specific to that browser on that device.
- Voice dictation depends on the browser's speech-recognition capability and is available in supported browsers only.
- PDF, Excel, and rich-render features rely on third-party libraries loaded from a public CDN at run time.
- The application is a single self-contained HTML file with no backend or database.

5. Functional Requirements

5.1 Task Capture

ID	Requirement	Priority
FR-1	The system shall let the user create a ticket by typing, by pasting rich content from an email, or by dictating with voice.	Must
FR-2	Rich paste shall preserve fonts, colours, bold/italic, lists, tables, and images, while removing scripts and unsafe content.	Must
FR-3	The system shall clean pasted email content by removing blank lines, redundant spacing, and empty wrappers.	Must
FR-4	Voice dictation shall run continuously until the user stops it and shall append (not overwrite) existing content.	Must
FR-5	Pasted images and wide tables shall be constrained to fit within the input and card, never overflowing the edge.	Must

ID	Requirement	Priority
FR-6	The task input area shall grow with content and support multi-line entry.	Should

5.2 Ticket Metadata

ID	Requirement	Priority
FR-7	Each ticket shall support a date, task text, and status (Open/Closed).	Must
FR-8	Each ticket shall capture email context: From, CC, and Email date & time, displayed above the task text.	Must
FR-9	Each ticket shall capture Action item, primary POC, Email ID, Email title, and Email code.	Must
FR-10	The Email ID shall render as a clickable mailto link that pre-fills the subject from the Email title.	Should
FR-11	Each ticket shall record a creation timestamp that never changes, and an edited timestamp updated on each save.	Must

5.3 Sub-Steps (Checklist)

ID	Requirement	Priority
FR-12	A ticket shall support multiple sub-steps, each with its own checkbox.	Must
FR-13	The user shall be able to add and remove steps both while creating a ticket and later on the card.	Must
FR-14	When a ticket has steps, the ticket shall be automatically Closed only when all steps are checked, and Open otherwise.	Must
FR-15	A single "Tick all" control shall mark every step complete (and reverse it).	Must
FR-16	The card shall display step progress (e.g. 2/4).	Should

5.4 Multiple POCs

ID	Requirement	Priority
FR-17	A ticket shall support multiple additional POCs, each with a name and a note of what that person did.	Must
FR-18	Sub-POCs shall be addable and removable both at creation and on the card.	Must

5.5 Wall, Views, and Filtering

ID	Requirement	Priority
FR-19	On opening, the wall shall default to showing only the current day's tickets.	Must
FR-20	Tickets shall be grouped under per-date headers, newest date first.	Must
FR-21	The user shall be able to view a specific date, a whole month, or all dates.	Must
FR-22	The user shall filter the wall by status: All, Open, or Closed.	Must
FR-23	A keyword search shall match within a chosen field (Task text, Action, POC, From, CC, Email ID, Email title, Email code, Email date & time) or	Must

ID	Requirement	Priority
	across all fields.	
FR-24	After adding a ticket, the wall shall show the date the ticket was pinned to.	Should

5.6 Editing and Status

ID	Requirement	Priority
FR-25	The user shall edit a ticket's text and all metadata fields inline on the card.	Must
FR-26	The user shall toggle a ticket's Open/Closed status; for ticketed steps this shall tick or clear all steps.	Must
FR-27	The user shall delete a ticket.	Must

5.7 Export and Printing

ID	Requirement	Priority
FR-28	The system shall export to PDF, with rich content (formatting and images) faithfully rendered.	Must
FR-29	PDF pages shall be produced at a fixed A2 size so large images fit without crossing the page border.	Must
FR-30	The system shall export to Excel with one row per ticket and columns for all fields, including Sub-POCs and Steps.	Must
FR-31	The system shall export to a single HTML file that embeds content as inline SVG and can be printed to PDF at any paper size.	Must
FR-32	Quick "download current view" controls shall export exactly the filtered set currently shown (PDF, Excel, HTML).	Must
FR-33	The sidebar shall additionally allow export by single date, whole month, whole year, or everything.	Should
FR-34	Excel exports shall respect the active Open/Closed filter and reflect it in the file name.	Should

5.8 Saving, Backup, and Restore

ID	Requirement	Priority
FR-35	All changes shall be saved automatically to the browser's local storage.	Must
FR-36	Pressing Ctrl+S shall download a JSON backup of all tickets.	Must
FR-37	The user shall export all tickets to a JSON file and re-import them later.	Must
FR-38	Import shall add only tickets not already present (matched by ID), so re-importing the same file creates no duplicates.	Must

6. Non-Functional Requirements

ID	Requirement	Priority
NFR-1	Usability: The interface shall be operable from a single screen with an	Must

ID	Requirement	Priority
	icon rail and slide-in panels, requiring no training.	
NFR-2	Performance: Common actions (add, edit, filter, search) shall respond effectively instantly for typical data volumes.	Must
NFR-3	Portability: The entire application shall be a single HTML file runnable by opening it in a browser.	Must
NFR-4	Reliability: No user action shall cause data loss; local save is automatic and backups are user-controlled.	Must
NFR-5	Compatibility: The application shall work in current Chrome and Edge; voice and some rendering features are browser-dependent.	Should
NFR-6	Security & Privacy: Data shall remain on the user's device; pasted content shall be sanitised of scripts and unsafe markup.	Must
NFR-7	Accessibility: Colour, contrast, and control sizing shall support comfortable everyday use, including on mobile.	Should

7. Data Requirements

Each ticket is stored as a record with the following attributes:

Field	Description
id	Unique identifier for the ticket.
text	The task content as rich (formatted) HTML.
date	The date the ticket is pinned to (YYYY-MM-DD).
completed	Open/Closed status (derived from steps when steps exist).
action	The action item to be taken.
poc	The primary point of contact.
pocs	List of additional POCs, each with name and work done.
emailFrom / emailCc	The email sender and CC recipients.
emailWhen	Free-text email date & time (e.g. Fri 04-09-2026 11:52).
email / emailTitle / emailCode	Email address, subject/title, and reference code.
steps	List of sub-steps, each with text and done flag.
createdAt / updatedAt	Creation and last-edited timestamps.

Data is retained in the browser's local storage and persists across sessions on the same browser and device. Portable copies are produced via the JSON export/import feature.

8. Out of Scope

- Multi-user collaboration, shared workspaces, or real-time sync across devices.
- Server-side storage, user accounts, or authentication.
- Direct integration with email servers or automatic email ingestion.
- Cloud backup (backups are manual JSON files controlled by the user).

9. Assumptions, Dependencies, and Risks

Item	Description / Mitigation
CDN libraries	PDF, Excel, and rich-render libraries load from a public CDN; an internet connection is needed on first use. Mitigation: graceful messages when unavailable.
Local storage limits	Very large volumes or embedded images could approach browser storage limits. Mitigation: periodic JSON backup and housekeeping.
Browser data clearing	Clearing browser data removes local tickets. Mitigation: user-controlled JSON backup (Ctrl+S).
Remote email images	Images referenced from a mail server display only when online. Mitigation: embedded images always render; export notes the limitation.
Browser variance	Voice and print-to-PDF fidelity vary by browser. Mitigation: recommend Chrome/Edge; provide fallbacks.

10. Potential Future Enhancements

- Include sub-POC names in keyword search.
- Drag-to-reorder steps within a ticket.
- A visible indicator of the current view (e.g. "Viewing: Today").
- Optional colour-coding of the status cell in Excel or split Open/Closed sheets.
- Offline bundling of the formatting libraries for fully offline use.
